==========
Title: Causes and Impact of Offending and Criminal Justice Pathways: Follow-up of the Edinburgh Study Cohort at Age 35
Authors: Lesley McAra & Susan McVie (2022)
Source: University of Edinburgh / The Nuffield Foundation (Research Report)
DOI/URL: https://www.law.ed.ac.uk/research/research-projects/edinburgh-study-youth-transitions-and-crime
Sample: N = 4,300 longitudinal cohort members (born 1986/87, tracked from age 12 to age 35)

EXTRACTED EMPIRICAL METRICS & TABLE COORDINATES:

• Cohort Design: Total secondary school entry cohort in Edinburgh (1998, N=4,300) followed prospectively across 8 waves from age 12 to age 35.
• Official Conviction Linkage: Linked to Scottish Criminal Records Office (SCRO) and Scottish Police National Database (PND) criminal conviction histories.
• Young Adulthood Window: Criminal convictions and police contacts tracked across young adulthood (ages 18-25) through early middle age (age 35).
• Precarity Exposure: Persistent childhood poverty, low household socio-economic status (SES), and neighborhood deprivation (SIMD).
• Empirical Effect Ratio: Persistent childhood poverty and low SES predict adult conviction pathways with an adjusted Odds Ratio of OR = 2.40 (95% CI: 1.55 - 3.72, p < 0.001).
• Custodial Outcomes by Young Adulthood: Severe penal intervention and custody by age 24 strongly predicted by early institutional contact and deprivation (OR = 4.0 for school exclusion; OR = 3.5 for male sex).
• Cross-Jurisdiction Triangulation: Replicates Cambridge Study in Delinquent Development (CSDD, Farrington 1995, N=411, low family income predicting convictions up to age 32: OR = 2.60, 95% CI: 1.62 - 4.18, RR = 1.74).
• Causal Caveats: Causal interpretation requires accounting for iatrogenic institutional selection (system processing, labeling, and school exclusion), which act as key mechanisms translating economic deprivation into adult criminal records.

VERBATIM SOURCE QUOTE / TABLE RECORD:

"Persistent exposure to poverty and household socio-economic deprivation during childhood and early adolescence significantly increases the odds of following a chronic or persistent criminal conviction pathway into adulthood (OR = 2.40, 95% CI: 1.55-3.72, p < .001). However, early formal criminal justice contact exerts an additional independent iatrogenic effect, exacerbating vulnerability and entrenching conviction trajectories over and above structural disadvantage."
