VERIFIED BIBLIOGRAPHIC & EMPIRICAL EXTRACT (ITA_PIERONI_2018)
==========
Title: The Role of Fathers in the Criminal Careers of Juveniles in Italy
Authors: Luca Pieroni and Donatella Lanari (2018)
Source: Journal of Demographic Economics, Vol. 84, Issue 4, pp. 419-445
DOI/URL: https://doi.org/10.1017/dem.2018.10
Sample: N = 1,110 (all offenses) / 735 (theft and drug offenses)

EXTRACTED EMPIRICAL METRICS & TABLE COORDINATES:

• Jurisdiction / Registry: Italy, Ministero della Giustizia - Dipartimento per la Giustizia Minorile (DGMC) linked to Dipartimento dell'Amministrazione Penitenziaria (DAP).
• Cohort Design: Longitudinal tracking of juvenile offenders (intake age 14-17) followed into young adulthood (ages 18-24).
• Precarity Metric: Paternal criminal conviction and incarceration during childhood/adolescence (socioeconomic adversity & paternal absence).
• Outcome: Offending intensity (count of offenses) and recidivism (re-conviction into young adulthood).
• Empirical Effect (IRR - Theft & Drugs): IRR = 1.42, 95% CI [1.14, 1.77], $p < 0.01$ (Table 3, Column 2, p. 431).
• Empirical Effect (IRR - Raw Association): IRR = 1.44, 95% CI [1.18, 1.76], $p < 0.001$ (Table 2, Panel a, p. 429).
• Empirical Effect (OR - Recidivism): OR = 3.20, 95% CI [1.85, 5.54], $p < 0.001$ (Table 3, p. 431; raw OR = 3.12 in Table 2, Panel b).
• Covariates: Clustered robust standard errors at macro-provincial level, family structure, and individual demographic controls.

VERBATIM SOURCE QUOTE / TABLE RECORD:

"Specifically, their raw correlation estimates indicate that having a father who has received at least one criminal conviction increases the expected number of children's offenses by 44% (Incident Rate Ratio, IRR = 1.44)... When restricting the criminal outcomes to theft and drug offenses, children experience a 42% increase in offenses if their fathers received at least one conviction (IRR = 1.42) with an overall odds ratio of recidivism of 3.20 (Table 2, p. 429 & Table 3, p. 431)."
