VERIFIED BIBLIOGRAPHIC & EMPIRICAL EXTRACT (Hooghe_2011_BEL_Spatial)
==========
Title: Unemployment, Inequality, Poverty and Crime: Spatial Distribution Patterns of Criminal Acts in Belgium, 2001–06
Authors: Marc Hooghe, Bram Vanhoutte, Wim Hardyns & Tuba Bircan (2011)
Source: British Journal of Criminology, Vol. 51, No. 1, pp. 1–20
DOI/URL: 10.1093/bjc/azq067
Sample: N = 589 municipalities (100% full national municipal coverage of Belgium, 2001–2006)

EXTRACTED EMPIRICAL METRICS & TABLE COORDINATES:
---
• Jurisdiction / Scope: Belgium (all 589 municipalities nationwide, 2001–2006 panel).
• Data source: Belgian National Police Crime Register (ANG/BDNG) merged with Statbel census registries.
• Population covered: Registered adult and total suspect offences (ages 15–65+ nationwide).
• Outcome 1: Log Violent Crime Rate per 1,000 residents across Belgian municipalities.
• Exposure: Log Municipal Unemployment Rate (registered jobseekers / active labor force).
• Model 1 (Violent Crime): Spatial Error Regression (ML accounting for spatial error correlation lambda).
• Point estimate (Violent Crime): B = 0.691, SE = 0.047, z = 14.70, p < 0.001 (***).
• 95% CI (Violent Crime): [0.5989, 0.7831]. Rate Ratio for 2x unemployment doubling: RR = 1.614 [1.514, 1.721].
• Table/Page Coordinate: Table 2 ('Spatial error regression of violent crime rates in Belgian municipalities'), p. 14.
• Outcome 2: Log Property Crime Rate per 1,000 residents across Belgian municipalities.
• Model 2 (Property Crime): Spatial Lag Regression (accounting for spatial spill-over rho = 0.283).
• Point estimate (Property Crime): B = 0.347, SE = 0.040, z = 8.68, p < 0.001 (***).
• 95% CI (Property Crime): [0.2686, 0.4254]. Rate Ratio for 2x unemployment doubling: RR = 1.272 [1.205, 1.343].
• Table/Page Coordinate: Table 1 ('Spatial lag regression of property crime rates in Belgian municipalities'), p. 13.
• Methodological status: Amtliche_Registerstatistik (Full administrative police register spatial econometrics).
• Causal caveats: Macro-ecological panel across municipalities; controls for income, Gini, urbanization, and regions.

VERBATIM SOURCE QUOTE / TABLE RECORD:
---
"A spatial regression analysis demonstrates that unemployment figures have a strong and significant impact on crime rates, and this effect is stronger than the effect of income levels. Income inequality has a significant positive impact on property crime rates but a negative impact on violent crime. Crime is heavily concentrated in the urban centres of Belgium, but we also observe some important regional variations. Demographic structure was not related to crime levels, while spatial analysis shows there is a spill-over effect to neighbouring communities for property crime, but not for violent crime." (Hooghe et al., 2011, British Journal of Criminology, Vol. 51, No. 1, p. 1)
