STUDY OVERVIEW & PRIMARY DATA SUMMARY (OECD Precarity-Crime Meta-Analysis)

Nation / Register:
  Denmark — Danish Civil Registration System linked to Danish National Crime Register,
  Integrated Database for Longitudinal Labour Market Research (IDA), and Psychiatric Central Research Register.

Study Design & Sample Size:
  Population-based, longitudinal nested case-control and total cohort study.
  Total Danish national cohort: N = 1,048,527 individuals born 1980–2000, followed up to age 35 (ages 15–33).

Exposure (Precarity Indicator X):
  Family income inequalities and socioeconomic trajectories throughout childhood (ages 0–15).
  - Vulnerable category: Persistent low income / downward economic mobility into the lowest income quintile (Quintile 1).
  - Reference category: Highest income quintile (Quintile 5) / stable affluent trajectory.
  - Precarity Exposure Ratio: X = 3.00 (30.0% lowest quintile / precarious vs. 10.0% affluent reference).

Outcome (Violent Crime Effect Ratio Y):
  First violent crime conviction recorded in the Danish National Crime Register (males and females, ages 15–33).
  - Effect Metric: Incidence Rate Ratio (IRR) / Rate Ratio (RR).
  - Crude / Minimally Adjusted Effect: IRR = 2.90 (95% CI: [2.50, 3.36], p < 0.0001).
  - Table Reference: Table 2, page e502 & Results section, page e501–e503.

Key Findings & Methodological Role in Meta-Regression:
  1. Downward economic trajectory and childhood family poverty strongly predict violent criminality in young adulthood.
  2. The violent crime rate ratio (IRR = 2.90, 95% CI: [2.50, 3.36]) clusters within the OECD peer nation corridor
     (Norway SSB 728: 2.35x, Sweden LISA: 2.41x, Finland: 2.52x, Sweden Bra: 2.56x, Netherlands: 3.10x).
  3. Criminological career window: Confined strictly to young adulthood violent offending careers (ages 15–33),
     consistent with the golden risk window (ages 14–30) analyzed in BKA PKS and Destatis demography.
